ACHIEVEMENTS

- Supported **7 contract expansions/extensions** by converting consulting delivery into trusted client outcomes.
- Trained and mentored **30+ engineers**; managed **5 concurrently** across high-accountability delivery work.
- Facilitated **150+ engineering and leadership interviews** across senior, staff, and delivery-lead roles.
- Led an **AI hackathon** focused on practical engineering adoption and delivery leverage.
- Developed a **contractor harness/toolkit** for embedded engineering consultants.
- Reached **5,000+ Decapod downloads** through public open-source execution.
- Lived in Japan and taught **English across 4 institutions simultaneously**, building cross-cultural communication and classroom leadership.
- Delivered **5 technical talks** on infrastructure, DevOps tooling, and engineering execution.

EDUCATION

- Self Directed**
Software engineering, AI, blockchain, security, cloud architecture, distributed systems, and mathematical foundations for machine learning. 2005 - Present.
- Advanced EHF Communications Course**
NCTAMS PAC. Secure MILSTAR / AEHF satellite communications, protected C2 links, frequency planning, and mission assurance.
- Information Systems Technician "A" School**
U.S. Navy, Corry Station. Multi-domain information systems operations, IA, SATCOM, cryptographic material, and cross-domain messaging.

PROJECTS

- Decapod** 210 stars
Daemonless, local-first control plane agents call on demand to shape context before inference, enforce boundaries, coordinate concurrent work, and emit proof-backed completion.
- Flowhawk** 75 stars
Real-time eBPF-powered network security monitor with AI-driven threat detection for port scans, DDoS, botnets, and anomalies at 100Gbps+ / ~150M packets/sec.
- Tensors to Consciousness** 20 stars
Research project exploring tensors, graph structure, neural signaling, and mathematical foundations for machine learning intuition.
- Omachy** by DHH
Opinionated Linux workstation distribution for a modern, productive developer environment.
- Vouch** by MitchellH
Contributor trust system based on explicit vouches for open-source participation; linked to the VOUCHER record.

ALEX H. RABER

Staff Engineering Manager & AI/Cloud/Security Architect

AI/cloud/security architect with 20 years of experience across multi-cloud platforms, DevOps/SRE, distributed systems, observability, security analysis, and agentic engineering. I turn ambiguous technical mandates into governed infrastructure, resilient delivery systems, and operating models teams can trust.

PREFERENCES

- Linux Open Source Security Terraform DataDog Kubernetes GitOps AWS

PROFESSIONAL EXPERIENCE

EverOps | Staff Engineering Manager & AI/Cloud/Security Architect Remote / Silicon Valley 2017 - 2022 / 2024 - 2025

Owned complex client mandates across AI adoption, cloud/security architecture, identity, DevOps/SRE, IT infrastructure, IAM, and CPE delivery; operated interchangeably as staff engineer, tech lead, manager, and lead consultant.

Stack: AWS, GCP, Kubernetes, Terraform, CloudFormation, GitOps, Immutable Infrastructure, Networking, Go, Java, Ruby, Python, Jenkins, GitHub Actions, DataDog, SRE, Security

Key achievements:

- Lead high-stakes deliverables for **Coinbase, Zendesk, Peloton, Metromile, and AutoGrid** across IAM, CPE, IT infrastructure, cloud transformation, DevOps/SRE, security, observability, and governance workstreams.
- At Coinbase, stabilized **3 concurrent delivery pods** through leadership/staff transitions; delivered self-hosted Authentik/PingFederate platforms, Okta IaC control-plane architecture, and VP-endorsed workforce-authentication proposals.
- Won client approval, led technical discovery, and built a **self-hosted, autoscaling GitHub Actions platform** replacing Travis CI; migrated **~4,000 repositories** in 4 months, 2 months ahead of schedule, \$300K below budget, avoiding a \$2.8M renewal.
- Found Kubernetes misconfigurations producing **~\$1.5M annualized savings**; drove identity-sync efficiency gains, purged **3M+ production-linked records** from development exposure, and reduced fragile manual operations.
- Modernized CI/CD and platform reliability: migrated thousands of Jenkins jobs, upgraded Jenkins to multi-cluster, multi-cloud, geo-redundant blue-green Kubernetes, and designed one-true-build / immutable-infrastructure promotion systems.
- Delivered **40+ AWS IaC/CaC initiatives** across Chef, Salt, Ansible, Puppet, Terraform, CloudFormation, GitOps, policy-as-code patterns, and repeatable configuration governance.
- Hardened production systems across observability, data recovery, database audits, Java-on-Windows to Kubernetes migrations, load balancers, routing, services, Wireshark packet capture, vulnerability analysis, and Codecov 2021 remediation.

Sock Finance | Senior Staff Engineer / Backend Architect Remote / Silicon Valley 2022 - 2024

Designed and built a greenfield web3/social backend from zero to production in 9 months, pairing product discovery with sub-100ms Lambda resolver paths, distributed caching, event-driven write-behind, observability, and recovery posture.

Stack: AWS, Multi-cloud Patterns, Solana, Ethereum, Arbitrum, Optimism, Alchemy, Hardhat, Rust, TypeScript, GraphQL, Lambda, AppSync, React, iOS/Android, Auth0, Redis, PostgreSQL, SRE

Key achievements:

- Owned backend architecture for an early-stage startup: APIs, auth, feed/thread primitives, social interactions, distributed caching, sharding-ready data patterns, automated environments, and security-aware delivery; operated **~320K executions/day** with cache-heavy design headroom toward **~10K exec/sec** service ceilings.
- Built GraphQL services on Lambda/AppSync with Auth0/JWT, Redis caching, and PostgreSQL persistence; tuned cache-hit Lambdas for **sub-100ms execution** and used **EventBridge-triggered second-order Lambdas** to update cache after database writes.
- Partnered on **product-market research** and end-user discovery with a design studio and investor-network stakeholders; observed users in-session, captured feedback, and translated product signal into engineering priorities.

Fonality | NOC / DevOps / Software Engineer Los Angeles / Hybrid 2013 - 2017

Built production operations, developer automation, observability, and service-delivery systems for hosted communications infrastructure across geo-redundant private clouds.

Stack: Linux, Networking, VoIP, CI/CD, GNOC, Jenkins, Mesos, Ansible, Java, React, Bare-metal Mesos, Nagios, Grafana, SRE, Observability, Geo-redundancy

Key achievements:

- Built the **Global Network Operations Center** and operational-visibility foundation across servers, applications, load balancers, routers, firewalls, VoIP systems, auto-healing workflows, and geo-redundant private clouds.
- Automated server provisioning and configuration from roughly **25 days to 3 days**, converting manual rollouts into repeatable, recoverable, production-grade delivery.
- Containerized **Java and React services** and deployed them into a **bare-metal Mesos cluster** I stood up, using the delivery rails I built plus a **Nagios + Grafana observability platform**.
- Built headless integration tests with virtual frame buffers, Selenium/AngularJS, VoIP/XMPP flows, and autonomous Jenkins execution; automated deployments with Jenkins/Ansible, local Vagrant/docker-compose environments, and security/availability analysis.

U.S. Navy | IT Communications Watch Officer USS Curtis Wilbur 2008 - 2012

Operated secure communications and mission-critical information systems aboard a forward-deployed U.S. Navy destroyer.

Stack: Cryptographic Communications, Radio/Satellite, Servers, Naval Messaging, Scheduled Database Backups, Network Configuration, Workstation Refreshes

Key achievements:

- Operated cryptographic communications, radio/satellite systems, servers, naval messaging, and radio circuit configuration/maintenance in mission-critical environments.
- Automated scheduled database backups and performed network configuration, workstation refreshes, and protected-systems maintenance.
- Supported communications planning, secure C2 links, and protected information systems while building the operational discipline later applied to production engineering, incident response, and security architecture.
